

SentinelNet Security Operations Center

Threat Detection & Monitoring Report

Prepared By: Darshnoor Kaur
Cybersecurity Monitoring Platform
Version: 1.0
Year: 2026

Executive Summary

SentinelNet is a Security Operations Center (SOC) monitoring platform developed for real-time network traffic inspection, threat detection, alert management, analytics visualization, and incident reporting. The platform continuously monitors suspicious network activity and generates alerts categorized into Critical, High, and Medium severity levels. This report summarizes the threats detected during the monitoring period and provides recommendations for improving security posture.

Threat Statistics

Metric	Value
Total Alerts	70
Critical Alerts	28
High Alerts	28
Medium Alerts	14
Security Score	9/100

Total alerts detected: 70. Critical alerts represent the highest-risk security events and require immediate investigation.

Top Threats Detected

Port	Service	Severity	Count
23	Telnet	High	14
445	SMB	High	14
1337	Backdoor Activity	Critical	14
3389	RDP	Medium	14
4444	Metasploit	Critical	14

Critical Threat Analysis

Critical alerts indicate potentially dangerous services, suspicious communication patterns, or ports commonly associated with exploitation frameworks and unauthorized access attempts. Ports such as Telnet (23), SMB (445), RDP (3389), and Metasploit-related services should be closely monitored and restricted where possible.

Security Recommendations

- Investigate all Critical alerts immediately.
- Disable unnecessary services and ports.
- Implement firewall-based traffic filtering.
- Enable continuous network monitoring.
- Deploy IDS/IPS solutions.
- Perform regular vulnerability assessments.
- Apply operating system and software patches.
- Restrict remote administration services.

Conclusion

SentinelNet successfully demonstrated real-time threat monitoring, alert generation, incident analysis, and security reporting. The platform provides security analysts with actionable insights through threat analytics, incident reports, and dashboard visualization. Future enhancements may include machine learning-based anomaly detection, automated threat intelligence feeds, and cloud-based deployment.
